#### **Foundations of Computer Graphics**

Online Lecture 6: OpenGL 1 Overview and Motivation

Ravi Ramamoorthi

#### **This Lecture**

- Introduction to OpenGL and simple demo code mytest1.cpp; you compiled mytest3.cpp for HW 0
- I am going to show (and write) actual code Code helps you understand HW 2 better
- Simple demo of mytest1
- This lecture deals with very basic OpenGL setup. Next 2 lectures will likely be more interesting

#### Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

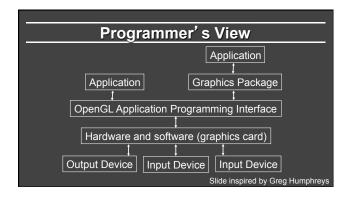

#### Introduction to OpenGL

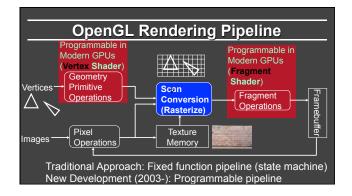

- OpenGL is a graphics API
   Portable software library (platform-independent)

  - Layer between programmer and graphics hardware Uniform instruction set (hides different capabilities)
- OpenGL can fit in many places
   Between application and graphics system
   Between higher level API and graphics system

#### Why OpenGL?

- Why do we need OpenGL or an API?
  - Encapsulates many basic functions of 2D/3D graphics
     Think of it as high-level language (C++) for graphics
     History: Introduced SGI in 92, maintained by Khronos
     Precursor for DirectX, WebGL, Java3D etc.

#### **GPUs and Programmability**

- Since 2003, can write vertex/pixel shaders
- Fixed function pipeline special type of shader
- Like writing C programs (see GLSL book)
- Performance >> CPU (even used for non-graphics)
- Operate in parallel on all vertices or fragments

#### Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

#### **Foundations of Computer Graphics**

Online Lecture 6: OpenGL 1

Basic Setup and Buffers, Matrix Modes

Ravi Ramamoorthi

#### **Outline**

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

#### **Buffers and Window Interactions**

- Buffers: Color (front, back, left, right), depth (z), accumulation, stencil. When you draw, you write to some buffer (most simply, front and depth)
- Buffers also used for vertices etc. Buffer data and buffer arrays (will see in creating objects)
- No window system interactions (for portability)
  - But can use GLUT (or Motif, GLX, Tcl/Tk)
  - Callbacks to implement mouse, keyboard interaction

#### Basic setup (can copy; slight OS diffs)

```
int main(int argc, char** argv)
        glutInit(&argc, argv);
// Requests the type of buffers (Single, RGB).
// Think about what buffers you would need...
glutInitDisplayMode (GLUT_SINGLE | GLUT_RGB);
// Need to add GLUT_3 2_CORE_PROFILE for Apple/Mac OS
glutInitWindowSize (500, 500);
glutInitWindowPosition (100, 100);
glutCreateWindow ("Simple Demo with Shaders");
// glewInit(); // GLEW related stuff for non-Apple systems
init (); // Always initialize first
          // Now, we define callbacks and functions for various tasks.
```

#### Basic setup (can copy; slight OS diffs)

```
int main(int argc, char** argv)
      // Now, we define callbacks and functions for various tasks.
      glutDisplayFunc(display);
glutReshapeFunc(reshape)
     glutKeyboardFunc(keyboard);
glutMeyboardFunc(keyboard);
glutMotionFunc(moused);
glutMotionFunc(mousedrag);
glutMainLoop(); // Start the main code
deleteBuffers(); //Termination. Delete buffers generated in init()
return 0; /* ANSI C requires main to return int. */
```

#### **Outline**

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

#### Viewing in OpenGL

- Inspired by old OpenGL. Now, only best practice, not requirement
   You could do your own thing, but this is still the best way to develop viewing
- Viewing consists of two parts
  - Object positioning: *model view* transformation matrix View projection: *projection* transformation matrix
- Old OpenGL (no longer supported/taught in 167x), two matrix stacks
   GL\_MODELVIEW\_MATRIX, GL\_PROJECTION\_MATRIX
   Can push and pop matrices onto stacks
- New OpenGL: Use C++ STL templates to make stacks as needed
  - e.g. stack <mat4> modelview; modelview.push(mat4(1.0)); GLM libraries replace many deprecated commands. Include mat4

#### Viewing in OpenGL

- Convention: camera always at the origin, pointing in the −z direction
- Transformations move objects relative to the camera
- In old OpenGL, Matrices are column-major and right-multiply top of stack. (Last transform in code is first actually applied). In new GLM, similarly (read the assignment notes and documentation).

#### Basic initialization code for viewing

```
#include <GL/glut.h> //also <GL/glew.h>; <GLUT/glut.h> for Mac OS
#include <stdlib.h> //also stdio.h, assert.h, glm, others
int mouseoldx, mouseoldy; // For mouse motion GLfloat eyeloc = 2.0; // Where to look from; initially 0 -2, 2 glm::mat4 projection, modelview; // The mvp matrices themselves
```

Online Lecture 6: OpenGL 1

Window System Interaction and Callbacks

Ravi Ramamoorthi

#### Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

### **Window System Interaction**

- Not part of OpenGL
  - Toolkits (GLUT) available (also freeglut)
- Callback functions for events (similar to X, Java,)
  - Keyboard, Mouse, etc.
  - Open, initialize, resize window
- Our main func included

glutDisplayFunc(display);
glutReshapeFunc(reshape);
glutKeyboardFunc(keyboard);
glutMouseFunc(mouse);
glutMotionFunc(mousedrag);

#### Basic window interaction code

```
/* Defines what to do when various keys are pressed */
void keyboard (unsigned char key, int x, int y)
{
   switch (key) {
    case 27: // Escape to quit
      exit(0);
      break;
   default:
      break;
}
```

#### Basic window interaction code

## 

```
Mouse drag (demo)
void mousedrag(int x, int y) {
  int yloc = y - mouseoldy ;
                                 // We will use the y coord to
zoom in/out
 eyeloc += 0.005*yloc;
if (eyeloc < 0) eyeloc = 0.0;
mouseoldy = y;</pre>
                                  // Where do we look from
  /* Set the eye location */
 glutPostRedisplay() ; }
```

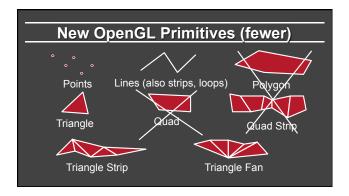

#### **Foundations of Computer Graphics**

Online Lecture 6: OpenGL 1 Drawing Basic OpenGL Primitives

Ravi Ramamoorthi

#### **Outline**

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

#### Geometry

- Points (GL\_POINTS)
   Stored in Homogeneous coordinates
- Line segments (GL\_LINES)

   Also (GL\_LINE\_STRIP, GL\_LINE\_LOOP)
- Triangles (GL\_TRIANGLES)

   Also strips, fans (GL\_TRIANGLE\_STRIP, GL\_TRIANGLE\_FAN)
- More complex primitives (GLUT): Sphere, teapot, cube,...
   Must now be converted into triangles (which is what skeleton does)

#### Old OpenGL: Drawing

- Enclose vertices between glBegin() ... glEnd() pair
  - Can include normal C code and attributes like the colors
  - Inside are commands like glVertex3f, glColor3f
  - Attributes must be set before the vertex
- Assembly line (pass vertices, transform, shade)
  - These are vertex, fragment shaders on current GPUs
  - Immediate Mode: Sent to server and drawn

# Old OpenGL: Drawing (not used) void display(void) { glClear (GL\_COLOR\_BUFFER\_BIT); // draw polygon (square) of unit length centered at the origin // This code draws each vertex in a different color. glBegin (GL\_POLYGON); glColor3f (1.0, 0.0, 0.0); glVertex3f (0.0, 1.0, 0.0); glVertex3f (0.0, 1.0, 0.0); glVertex3f (-0.5, 0.5, 0.0); glVertex3f (-0.5, -0.5, 0.0); glVertex3f (-0.5, -0.5, 0.0); glVertex3f (0.0, 1.0, 1.0); glVertex3f (0.5, -0.5, 0.0); glPelush (); BLUE WHITE

#### Old OpenGL: Drawing

- Client-Server model (client generates vertices, server draws) even if on same machine
  - glFlush() forces client to send network packet
  - glFinish() waits for ack, sparingly use synchronization
- New OpenGL: Vertex Array Objects (next)

#### Modern OpenGL: Floor Specification

#### Modern OpenGL: Vertex Array Objects

```
const int numobjects = 2; // number of objects for buffer
const int numperobj = 3; // Vertices, colors, indices
GLuint VAOs[numobjects]; // A Vertex Array Object per object
GLuint buffers[numperobj*numobjects]; // List of buffers geometric data
GLuint objects[numobjects]; // For each object
GLenum PrimType[numobjects]; // Primitive Type (triangles, strips)
GLsizei NumElems[numobjects]; // Number of geometric elements

// Floor Geometry is specified with a vertex array
enum (Vertices, Colors, Elements); // For arrays for object
enum (FLOOR, FLOOR2); // For objects, for the floor

//------In init below (creates buffer objects for later use)------
```

#### Modern OpenGL: Vertex Array Objects

```
const int numobjects = 2; // number of objects for buffer
const int numperobj = 3; // Vertices, colors, indices

GLuint VAOs[numobjects]; // A Vertex Array Object per object

GLuint buffers[numperobj*numobjects]; // List of buffers geometric data
//...
//-----In init below (creates buffer objects for later use)-----
glGenVertexArrays(numobjects, VAOs); //create unique identifiers
glGenBuffers(numperobj*numobjects, buffers); //and for buffers

void deleteBuffers() { // Like a destructor
glDeleteVertexArrays(numobjects, VAOs);
glDeleteBuffers(numperobj*numobjects, buffers);
}
```

#### Modern OpenGL: Initialize Buffers

```
void initobject (GLnint object, GLfloat * vert, GLint sizevert, GLfloat *
    col, GLint sizecol, GLubyte * inds, GLint sizeind, GLenum type) {
    int offset = object * numperobj;
    glBindVertexArray(VAOs(object]);
    glBindBuffer(GL_ARRAY_BUFFER, buffers[Vertices+offset]);
    glBufferData(GL_ARRAY_BUFFER, sizevert, vert,GL_STATIC_DRAW);
    // Use layout location 0 for the vertices
    glEnableVertexAttribArray(0);
    glVertexAttribArray(0);
    glVertexAttribArray(0);
    glBindBuffer(GL_ARRAY_BUFFER, buffers[Colors+offset]);
    glBindFer(GL_ARRAY_BUFFER, buffers[Colors+offset]);
    glBufferData(GL_ARRAY_BUFFER, sizecol, col,GL_STATIC_DRAW);
    // Use layout location 1 for the colors
    //...
}
```

#### **Modern OpenGL: Initialize Buffers**

```
void initobject (GLuint object, GLfloat * vert, GLint sizevert, GLfloat *
    col, GLint sizecol, GLubyte * inds, GLint sizeind, GLenum type) {
    // ...

    // Use layout location 1 for the colors
    glEnableVertexAttribArray(1);
    glVertexAttribPointer(1, 3, GL_FLOAT, GL_FALSE, 3 * sizecf(GLfloat), 0);
    glBindBuffer(GL_ELEMENT_ARRAY_BUFFER, buffers[Elements+offset]);
    glBufferData(GL_ELEMENT_ARRAY_BUFFER, sizeind, inds, GL_STATIC_DRAW);
    PrinType[object] = type;
    NumElems[object] = sizeind;
    // Prevent further modification of this VAO by unbinding it
    glBindVertexArray(0);
}
```

#### Modern OpenGL: Draw Vertex Object

### **Initialization for Drawing, Shading**

#### **Demo (change colors)**

#### **Foundations of Computer Graphics**

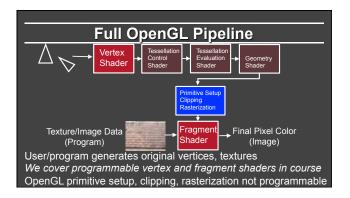

Online Lecture 6: OpenGL 1

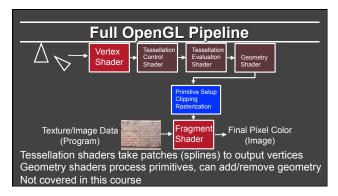

Initializing Shaders

Ravi Ramamoorthi

#### Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

#### Simplified OpenGL Pipeline

- User specifies vertices (via vertex arrays)
- For each vertex in parallel
  - OpenGL calls user-specified vertex shader: Transform vertex (ModelView, Projection), other ops
- For each primitive, OpenGL rasterizes
  - Generates a *fragment* for each pixel the primitive covers
- For each fragment in parallel
  - OpenGL calls user-specified fragment shader: Shading and lighting calculations
    OpenGL handles z-buffer depth test unless overwritten

#### **Shader Setup**

Initializing (shader itself discussed later)

- Create shader (Vertex and Fragment)
- Compile shader
- Attach shader to program
- Link program
- Use program

#### **Shader Setup**

- Shader source is just sequence of strings
- Similar steps to compile a normal program

#### **Shader Initialization Code**

```
GLuint initshaders (GLenum type, const char *filename) {
 // Using GLSL shaders, OpenGL book, page 679 of 7th edition
 GLuint shader = glCreateShader(type) ; GLint compiled ;
 string str = textFileRead (filename) ;
 const GLchar * cstr = str.c_str() ;
 glShaderSource (shader, 1, &cstr, NULL) ;
 glCompileShader (shader) ;
 glGetShaderiv (shader, GL_COMPILE_STATUS, &compiled) ;
 if (!compiled) {
   shadererrors (shader) ;
   throw 3 ; }
return shader ;
```

#### **Linking Shader Program**

```
GLuint initprogram (GLuint vertexshader, GLuint fragmentshader) {
  GLuint program = glCreateProgram() ;
  GLint linked ;
  glAttachShader (program, vertexshader) ;
 glAttachShader(program, fragmentshader) ;
  glLinkProgram(program) ;
  glGetProgramiv(program, GL_LINK_STATUS, &linked) ;
  if (linked) glUseProgram(program) ;
  else {
    programerrors(program) ;
 cout<<"Shader program successfully attached and linked." << endl;</pre>
return program ; }
```

#### Basic (nop) vertex shader

```
In shaders/ nop.vert.glsl nop.frag.glsl
Written in GLSL (GL Shading Language)
Vertex Shader (out values interpolated to fragment)
// Do not modify the above version directive to anything older.
// Shader inputs
layout (location = 0) in vec3 position;
layout (location = 1) in vec3 color;
out vec3 Color;
uniform mat4 modelview;
uniform mat4 projection;
void main() {
```

```
Basic (nop) vertex shader

In shaders/ nop.vert.glsl nop.frag.glsl
Written in GLSL (GL Shading Language)
Vertex Shader (out values interpolated to fragment)
layout (location = 0) in vec3 position;
layout (location = 1) in vec3 color;
// Shader outputs, if any
out vec3 Color;
// Uniform variables
void main() {
       Color = color; // Just forward this color to the fragment shader
```

#### Basic (nop) fragment shader

```
# version 330 core
// Do not modify the version directive to anything older than 330.
// Fragment shader inputs are outputs of same name from vertex shader
in vec3 Color;
// Uniform variables (none)
// Output
out vec4 fragColor;
void main (void)
   fragColor = vec4(Color, 1.0f);
```
